

Precision Insight and Control over Active Directory

Active Directory™ is the centerpiece of any Windows™ network. Active Directory experiences a tremendous amount of change on a daily basis, as administrators, other applications, and even users make modifications to Active Directory-related objects and configurations. While some changes are more significant than others, organizations need (and are even required in some cases) to capture information about all changes occurring in Active Directory, but cannot. They also struggle to understand what these changes mean and the effect they're having on the environment as a whole; both operationally and in terms of security and compliance. Native logging facilities have proven to be less than optimal in solving this problem – regardless of organizational size – spurring the necessity for a more meaningful and precise approach, capable of enabling IT action to secure the enterprise.

Answering the Who, What, Where, When™ for Active Directory

StealthINTERCEPT™ Directory Authority uniquely addresses the most difficult Active Directory change monitoring and control challenges with surgical precision and ultimate flexibility.

In-Line – Not just “real-time”

Anything that should be monitored within Active Directory may also need to be controlled. The problem with event analysis solutions is that their value ends when an event is logged; just when the problem may be beginning for IT.

StealthINTERCEPT works in-line with key Active Directory processes in order to categorize and capture information while events are happening. This unique capability enables StealthINTERCEPT to choose which events matter, trigger real-time responses and assemble a more complete record than any provided by a log. StealthINTERCEPT provides crucial change details that alternative solutions and methods cannot such as the source IP address, change requestor identification, and the value of a setting or property before or after a change was made.

“StealthINTERCEPT allows me to understand every change occurring in my Active Directory implementation in real time, and in a language I can understand. Better yet, StealthINTERCEPT allows me to proactively prevent changes before they happen, reducing issue resolution time while significantly increasing automation and security for my organization.”

- Regional US Bank

Key Benefits

- In-line, real-time monitoring and blocking of any Active Directory change event (including Group Policy Objects)
- Precision control over what or who is monitored, blocked, archived or alerted upon, as well as where and when
- License just the functionality needed, at an affordable price point
- Requirement fulfillment for Operations, Security, Audit & Compliance groups

Precision – “Boiling the Ocean” won’t work

In alignment with typical audit and compliance requirements, StealthINTERCEPT has the ability to capture all change activity occurring within Active Directory without reliance on native logging, however, what IT really needs is to be presented with complete information about the changes which matter most and require response. StealthINTERCEPT incorporates a unique Rules Engine which makes it not only easy to describe critical events, but easy to propagate these rules throughout a complex network to ensure that the rules are precisely enacted.

Flexibility – What you want, is exactly what you get

StealthINTERCEPT was architected with flexibility in mind; particularly with concern to licensing. Recognizing the need for the functionality StealthINTERCEPT provides and the market’s inability to afford the hefty price tag often associated with incumbent solutions in this space, STEALTHbits has changed the game by offering customers the ability to license only the components they want or need, at an even more affordable cost than the competition.

Benefits – Need to Know and Control

StealthINTERCEPT’s in-line architecture and Rules Engine combine to deliver an unequalled benefit for IT. Drawing comparison to the common inadequacies of monitoring solutions where users are forced to gather more data than is needed and suffer the frustration of countless false-positives, StealthINTERCEPT is the only solution which can truly be said to provide “need to know” information. With StealthINTERCEPT, IT can be certain that information provided by the product is not just accurate, but relevant.

Furthermore, StealthINTERCEPT’s in-line processes produce another critical benefit for IT – true control. Because these processes are interacting with Active Directory as events are being processed, StealthINTERCEPT acts as the mechanism by which desired controls are implemented within Active Directory – including blocking an event from occurring or rolling back the outcome.

About STEALTHbits Technologies, Inc.

STEALTHbits Technologies delivers high quality, affordable solutions aligning to the most difficult problems organizations face in the management and security of their mission critical Microsoft infrastructure and applications. For more information, visit STEALTHbits online at www.stealthbits.com.

SYSTEM REQUIREMENTS

Operating Systems:

- Windows Server 2003/2008

Memory:

- 4GB

Disk Space:

- 100GB Free Disk Space

Additional Software:

- SQL Server 2005/2008/2008 R2
- .Net 4.0
- IIS 6 (Win 2003) or IIS 7 (Win 2008)
